Therefore, the equation of the regression line is $\hat{y} = 2.71x + 88.07$.

Even though we found an equation, recall that the correlation

between x and y in this example was weak.

Thus, this regression line may not work very well for the data.

For example, for a student with $x = 0$ absences, plugging in, we find that the grade predicted by the regression

Statistics

Multicollinearity occurs when independent variables in a regression model are correlated. This correlation is a problem because independent variables should be independent. If the degree of correlation between variables is high enough, it can cause problems when you fit the model and interpret the results.

Problems And

Multicollinearity in Regression Analysis: Problems ...

Multiple regression generally explains the relationship between multiple independent or predictor variables and one dependent or criterion variable. A dependent variable is modeled as a function of several independent variables with corresponding coefficients, along with the constant term.
